

## International Debt Statistics (Overview)

In this project, I explored and analyzed international debt data collected by The World Bank using PostgreSQL. The dataset contains information about the amount of debt (in USD) owed by developing countries across several categories. I provided answers to questions like:

What is the total amount of debt that is owed by the countries listed in the dataset?

Which country owes the maximum amount of debt and what does that amount look like?

What is the average amount of debt owed by countries across different debt indicators?

Below is a basic schema of the database I worked with:

### **debt\_indicators table**

Column	Definition	Data Type
country_name	Name of the country	varchar
country_code	Code representing the country	varchar
indicator_name	Description of the debt indicator	varchar
indicator_code	Code representing the debt indicator	varchar
debt	Value of the debt indicator for the given country (in USD)	float
